Next generation eID - MitID

- One national eID solution across public and private sector has been crucial to the digital development.
- The tender for the next generation of NemID, MitID, has been an opportunity to develop a more modular infrastructure making the new MitID able to meet user, technical and security needs in the future.
- MitID will build on one common identity infrastructure.
- This infrastructure may be used by public players as well as financial institutions and other private service providers with a need for secure digital identities.

MitID – The setup
